

Green Cycle - Project Stakeholders

Authors: *Boris Marinković, Janko Kondić, Nikola Gostovikj*

Date: *March 31, 2026*

1. Stakeholder Analysis

The following sections cover each identified stakeholder. Stakeholders are ordered from most directly involved in development to those with more indirect interest.

1.1. IT Management Course (Client)

<i>Stakeholder</i>	IT Management Course
<i>Status</i>	Positive
<i>Expectations & Interests</i>	The team expects the project to be delivered on time, following the milestones defined in the <i>Green Cycle - Project Charter</i> (backend by end of March, primary features by end of April, secondary features by end of May, final delivery by end of June). They expect iterative delivery with working increments after each phase, written progress reports, and final documentation.
<i>Conflicts & Benefits</i>	Potential conflict if deadlines are missed or if the team tries to change requirements after they have been locked in the contract. The charter explicitly states that feature specifications cannot be changed mid-development. <i>Benefit</i> : the team provides structure and accountability that helps the team stay focused.
<i>Team Response</i>	We treat the team as our formal client. All deliverables are prepared according to the milestone schedule.

1.2. Development Team (Boris Marinković, Janko Kondić, Nikola Gostovikj)

<i>Stakeholder</i>	Development Team
<i>Status</i>	Positive
<i>Expectations & Interests</i>	The team expects to complete the project within the 4-month window and the €3,000 budget. Each member has a defined role (more information can be found in <i>Green Cycle - Scrum Basics</i>). The team expects the workload to be distributed fairly according to these roles and that sprint planning decisions made in Sprint 0 are respected throughout.

<i>Conflicts & Benefits</i>	Internal conflicts could arise from uneven workload distribution, or disagreements about implementation decisions. The main benefit is that all three members are both stakeholders and the team itself, which means everyone has a direct interest in the final product being good.
<i>Team Response</i>	Roles are clearly defined in the <i>Green Cycle - Scrum Basics</i> document and we refer back to these when responsibilities are unclear.

1.3. Eco-Conscious Individuals

<i>Stakeholder</i>	Eco-Conscious Individuals
<i>Status</i>	Positive
<i>Expectations & Interests</i>	This group wants a platform where they can easily search for upcycling projects by the materials they already have at home, with beginner-friendly difficulty levels. They are frustrated by scattered information on general platforms like Instagram and Pinterest. Discoverability and filtering are the most important features for this group.
<i>Conflicts & Benefits</i>	No real conflict. This is the core target audience and the platform is designed primarily around their needs. The risk is that if the material search and filtering features are not well implemented, this group will not find the platform useful and will continue using other social media platforms instead.
<i>Team Response</i>	Material-based search and difficulty filtering were confirmed as the high priority features during hypothesis testing. Based on usability testing, we moved the material search field to a more suitable position on the homepage. We will continue to prioritize these features in Sprint 2.

1.4. Teachers

<i>Stakeholder</i>	Teachers
<i>Status</i>	Positive
<i>Expectations & Interests</i>	Teachers want filters for classroom suitability: age group, estimated cost per student, and activities that do not require expensive or dangerous tools. They are also interested in contributing their own tested classroom activities and getting recognition for it.
<i>Conflicts & Benefits</i>	The main risk here is that if the age group and cost filters are not visible and intuitive, teachers will not use the platform

	despite being interested in it. Usability testing showed that the age group filter was difficult to find and the cost indicator on project cards was too small to notice. These are specific UI problems that need to be fixed.
<i>Team Response</i>	We added a “No special equipment needed” tag option directly in response to teacher feedback during hypothesis testing. The usability testing results (Task 3 being the most problematic) are tracked as issues and will be addressed in Sprint 2 alongside the main filter implementation.

1.5. Small Eco-Business Owners

<i>Stakeholder</i>	Small Eco-Business Owners
<i>Status</i>	Positive
<i>Expectations & Interests</i>	This group wants visibility to an audience that is already eco-conscious and potentially willing to pay for handmade products. They are frustrated by the low organic reach on Instagram. Their interests include being able to build a public portfolio of projects, earn credibility through platform badges, and potentially find material suppliers within the community.
<i>Conflicts & Benefits</i>	A concern raised during hypothesis testing was about sharing techniques publicly due to fear of being copied. This is a real problem, the platform benefits from creators sharing detailed guides, but some business owners may hold back if they feel it risks their competitive advantage.
<i>Team Response</i>	The profile page was updated to show published projects more prominently based on usability testing feedback. The copying concern is noted but not directly solvable through platform features.

1.6. Platform Administrators

<i>Stakeholder</i>	Platform Administrators
<i>Status</i>	Neutral
<i>Expectations & Interests</i>	Admins need to manage users, roles, material categories, and achievements through an admin panel. They expect the admin interface to be functional and reliable, with the ability to add material categories (TC9.4.) and manage the achievement system.
<i>Conflicts & Benefits</i>	No conflict with the development team. The main risk is that if admin features are not prioritized or incomplete at delivery,

	long-term platform management will be difficult.
<i>Team Response</i>	Admin panel requirements are defined in the user stories (<i>TC7.4, TC9.4. and others</i>). We will ensure at minimum that the core admin functions (user management, material category management) are working before delivery.
